//note="Organ: Bone; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site 1: EcoR I; Site_2: Not I; NCI_CGAP_DF0 is a CDNA library containing the following tissue(s): Subchondral Bone. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gene Index

The polynucleotide and secreted protein are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating (e.g. as accines) or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, and tumour inhibition activity (no data is given in the specification to support these activities). The polynucleotide is also stated to be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 199

Novel secreted or transmembrane protein and protein, useful for diagnosis and treatment cancer, autoimmune diseases, bone disorders polynucleotide encoding the of neurological disorders, and lung or liver fibrosis

Claim 44; Page 112-113; 284pp; English

The invention relates to human secreted or transmembrane protein (I), certain their fragments and is encoded by specific complementary deoxyribonucleic acid (cDNA) inserts (II), where the protein is substantially free from their mammalian proteins. (I) are useful for preventing, treating or cameliorating a medical condition, especially immunological treatment or prevention of tumours. (I) exhibits activity relating to angiogenesis, cytokine, cell proliferation, cell differentiation, antiinflammatory, cell stem cell growth factor activity and activity or inhibin-related continuities. (I) can be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease, accidental damage or central and peripheral nervous system disease, accidental damage or central and peripheral nervous system diseases, accidental damage or central and peripheral nervous system diseases, and neuropathies, such as accidental damage or parkinson's disease, Huntington's disease, amyotrophic cell ateral sclerosis. (I) is involved in chemotactic or chemokinetic cell activity, regulation of haematopoiesis and is useful for treating myeloid cell disorders, platelet disorders such as thrombocytopaenia and for regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth and in tissue repair, healing of burns, incisions, ulcers, or regeneration and treatment of lung or liver fibrosis, repertision injury in various tissues, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, cell abetes mellitus, myasthenia gravis, allergic reactions and conditions, such as athma or other respiratory problems. (II) is useful to express cell protein is preferentially expressed and in gene therapy. The present cell sequence is that of a polypeptide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC expression is prevalent in normal mammary epithelial cells and in CC other human hormone-responsive tissues such as the owary, prostate CC and testis. Expression is low in breast cancer epithelial cells. CC Oestradiol, which induces breast cancer cell growth, has an CC inhibitory effect on EDG1 mRNA expression in breast cancer cells. CC departions of the catternation and CC apoptosis, upregulates EDG1 mRNA expression in breast cancer cells. CC The invention provides EDG1 polynucleotides and polypeptides. In CC a claimed method of detecting cancerous cells, a test sample from CC anindividual suspected of having, or known to have breast. CC contacted with an anti-EDG1 antibody. A decrease in the level CC or antigen-antibody complex compared to the level of a control CC sample indicates cancerous cells. A claimed method for decreasing CC cervical or colon cancer cells involves increasing EDG1 protein. CC cervical or colon cancer cells involves increasing EDG1 protein CC cervical or colon cancer cells involves increasing EDG1 protein CC cervical or colon cancer cells involves increasing EDG1 protein. CC cervical or colon cancer cells involves increasing EDG1 protein CC cervical or colon cancer cells involves increasing EDG1 protein. CC cervical or colon cancer cells involves increasing EDG1 protein. CC cervical or colon cancer cells involves increasing EDG1 protein. CC cervical or colon cancer cells involves increasing EDG1 protein. CC cervical or colon cancer cells involves increasing EDG1 protein. CC cervical or colon cancer cells involves increasing EDG1 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a sequence the polynucleotide which comprises a 3'-end sequence, where the polynucleotide comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           to the complementary strand of a polynucleotide which comprises one

The activity of polynucleotides of the invention may be described as, vulnerary, neuroprotective, immunomodulator, cytostatic and anti-inflammatory. Compositions comprising nucleic acids of the invention are useful for treating a mammalian subject, or as nutritional source.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tang
                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                               amyotrophic lateral sclerosis, autoimmune disorders, cancer or inflammation. The nucleic acids and polypeptides are also useful diagnostic and research methods. The sequences given in records ABP43544-ABP43989 represent polypeptides encoded by polynucleotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptides and their encoded proteins, useful as nutritional sources or supplements, or in gene therapy, particularly for treat wounds, Alzheimer's disease, amyotrophic lateral sclerosis, cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cytostatic; anti-inflammatory; gene therapy; nutritional supplement; wound; burn; ulcer; Alzheimer's disease; Huntington's disease; amyotrophic lateral sclerosis; autoimmune disorder; inflammation;
                                                                                                                                                                                                                                          NOTE: The sequence data for this patent did not form specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                       the invention.
                                                                                                                                                                                                                                                                                                                                     supplements. These are useful in gene therapy, particularly for treating wounds, burns or ulcers, Alzheimer's disease, Huntington's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 20; SEQ ID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        12-OCT-2000; 2000US-0687527

AAM25963. The proteins can have activities based on the tissues and cells they are expressed in, such as: antiinflammatory; antirheumatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; central nervous system; virucide; anti-HIV; fungicide; antimutagen; cardiovascular; antianaemic; antiaggregant; haemostatic; vulnerary; antiulcer; osteopathic; dermatological; antiallergic; antiasthmatic; antidabetic; cytostatic; neuroprotective; antidepressant; nootropic; antidabetic; cytostatic; neuroprotective; antidepressant; nootropic; antiparkinsonian; and immunostimulant. The proteins and polynucleotides encoding them can be used in gene therapy, antisense therapy and vaccine production. The proteins and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      anti-HIV; fungicide; antimutagen; cardiovascular; antianaemic; anaemia; antiaggregant; haemostatic; vulnerary; antiulcer; osteopathic; eczema; dermatological; antialprgic; antiasthmatic; antidabetic; cytostatic; neuroprotective; antidepressant; mootropic; antiparkinsonian; infection; immunostimulant; gene therapy; antisense therapy; vaccine; inflammation; antianaphylactic; rheumatoid arthritis; septic shock; pancreatitis; cardiac dysfunction; neuropathology; cardiac anaphylaxis; autoimmunity; genetic disease; haematopoietic disorder; platelet disorder; asthma; therapy; platelet disorder; asthma; therapy; cardiac anaphylaxis; autoimmunity; genetic disease; haematopoietic disorder; platelet disorder; asthma; therapy; cardiac anaphylaxis; autoimmunity; therapy; c

polypeptide (II) sequences. (1) is userus we recombine polymerase chain reaction (PCR) primers, oligomers, and for chromosome polymerase chain reaction (PCR) primers, oligomers, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy technique to restore normal activity of (II) or to treat disease states involving

(II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as affocting weight markers and a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, formation

            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                            31-MAR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   C polypeptide (II) sequences. (I) is useful as hybridisation probes,
C polymerase chain reaction (PCR) primers, oligomers, and for chromosome
C and gene mapping, and in recombinant production of (II). The
C polymclectides are also used in diagnostics as expressed sequence tags
C for identifying expressed genes. (I) is useful in gene therapy techniques
C to restore mormal activity of (II) or to treat disease states involving
C (II). (II) is useful for generating antibodies against it, detecting or
CC quantitating a polypeptide in tissue, as molecular weight markers and as
C a food supplement. (II) and its binding partners are useful in medical
C imaging of sites expressing (II). (I) and (II) are useful for treating
C disorders involving aberrant protein expression or biological activity.
C The polypeptide and polynucleotide sequences have applications in
C diagnostics forensics, gene mapping, identification of mutations
C responsible for genetic disorders or other traits to assess biodiversity
C and to produce other types of data and products dependent on DNA and
C amino acid sequences. ABG00010-ABG30377 represent novel human

AAU14602-AAU14794 represent novel bone marrow polypeptides of the CC invention. The proteins and corresponding coding sequences may be used CC in the prevention, diagnosis and treatment of diseases associated with CC inappropriate bone marrow polypeptide expression. For example, to treat CC or deletions in a patient's genome that affect the activity of the CC patient's own production of the polypeptide. Additionally, the nucleic cacids may be used to produce the polypeptides, by inserting the nucleic CC acids into a host cell and culturing the cell to express the protein. CC The nucleic acid and its complementary sequences may also be used as DNA CC probes in diagnostic assays to detect and quantitate the presence of CC similar nucleic acid sequences in samples, and therefore which patients CC and in assays to identify modulators of their expression and activity. The anti-bone marrow protein antibodies against bone marrow protein antibodies against bone mar also be used as to down regulate expression and activity. The antibodies may also be used consequently as the protein in samples for detecting the presence of the protein in assays to identify modulators of their expression and activity. The protein in samples as a nutritional supplement; and in treatment of myeloid or lymph cell disorders; in tissue regeneration, cc such as wound healing; as a nutritional supplement; and in treatment of immune disorders such as severe combined immunodeficiency (SCID).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 10; Page 215-217; 392pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in disgnostice as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations reports to the content of the polyperide and polynucleotide sequences have applications in the polypeptide sequences have applications in the polypeptide and polynucleotide sequences have applications in the polypeptide sequences have applications applications and the polypeptide sequences have applications applications 
                                                                                                                                         Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
   Sequence
                                                                                                                                                                                capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid genes from Drosophila and interactions -
                                                                                         The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2001-656860/75.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel method for the diagnosis of a disease CC caused by, or associated with, an RNA molecule that has a frameshift cc mutation. The method is used to diagnose age-related diseases, especially cancer and a wide range of neurodegenerative disorders (e.g. Alzheimer's clisease, Down's syndrome, myotonic dystrophy, Huntington's disease, comultiple sclerosis, alcoholic liver disease, diabetes mellitus type II cand many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients, caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including beta-amyloid precursor protein (beta-App), the microtubule associated protein 2 (MAP2), neurofilament-I, neurofilament-M, associated protein 2 (MAP2), neurofilament-I, neurofilament-M, courtein (GFAP), the cellular tumour antigen p53, B-cell leukemia/lymphoma (bcl-) proto-oncogene, semaphorin III, HUPF-1, high mobility group courted by the courtein-C (HMGP-C) and neuroendocrine specific protein A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             corvix. From this the sequences of p52 and p75 were identified. The p52 and to a lesser extent p75 proteins were found to act as general transcriptional coactivators. In addition p52 was found to enhance ASF/SF2-mediated pre-mRNA splicing. The p52 and p75 polypeptides can be used to treat disease caused by defects in transcription or in ASF/SF2-mediated pre-mRNA splicing. These disease may also be treated by gene therapy, using p52 and p75 polypuncleotides. An example of a treatable disease is cancer, especially breast cancer. The present sequence is the human p75 protein, GenBank Accession No.

The method is used for diagnosing patients with atopic dermatitis, and for detecting atopic dermatitis in patients suffering from other conditions such as asthma or interstitial cystitis. This sequence represents the
